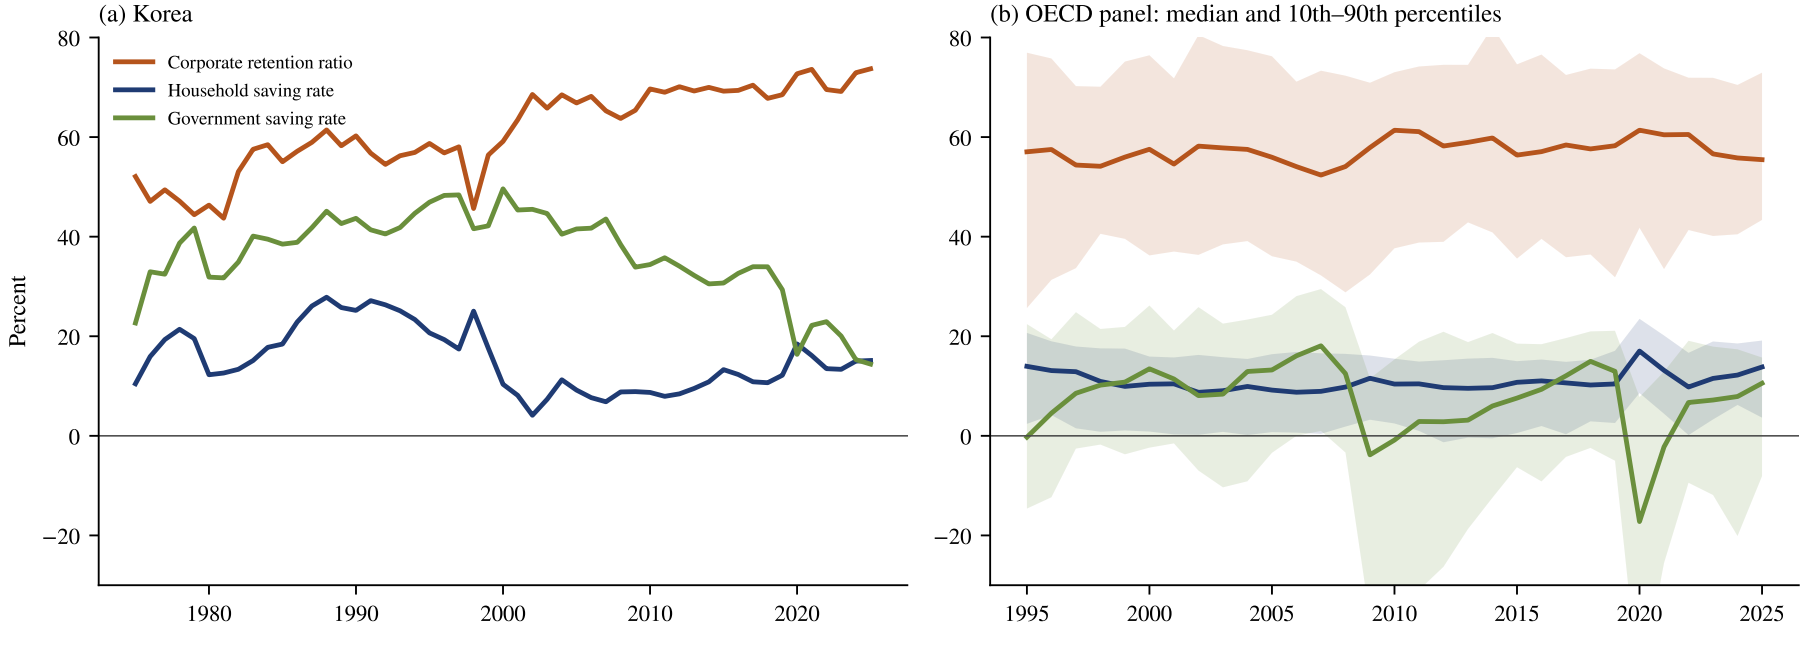
Across economies, government saving ratios swing far more than corporate and household ones



Notes: Gross saving of each sector divided by its operating surplus (corporations) or disposable income (households, government), percent. Annual OECD sector accounts. Across all country-years, the share at or below zero is 0.4, 7.4 and 29.8 percent, and the median absolute annual change relative to the previous level is 5, 11 and 37 percent, for the corporate, household and government ratios. (b) Years with at least ten economies. Source: OECD; authors' calculations.
