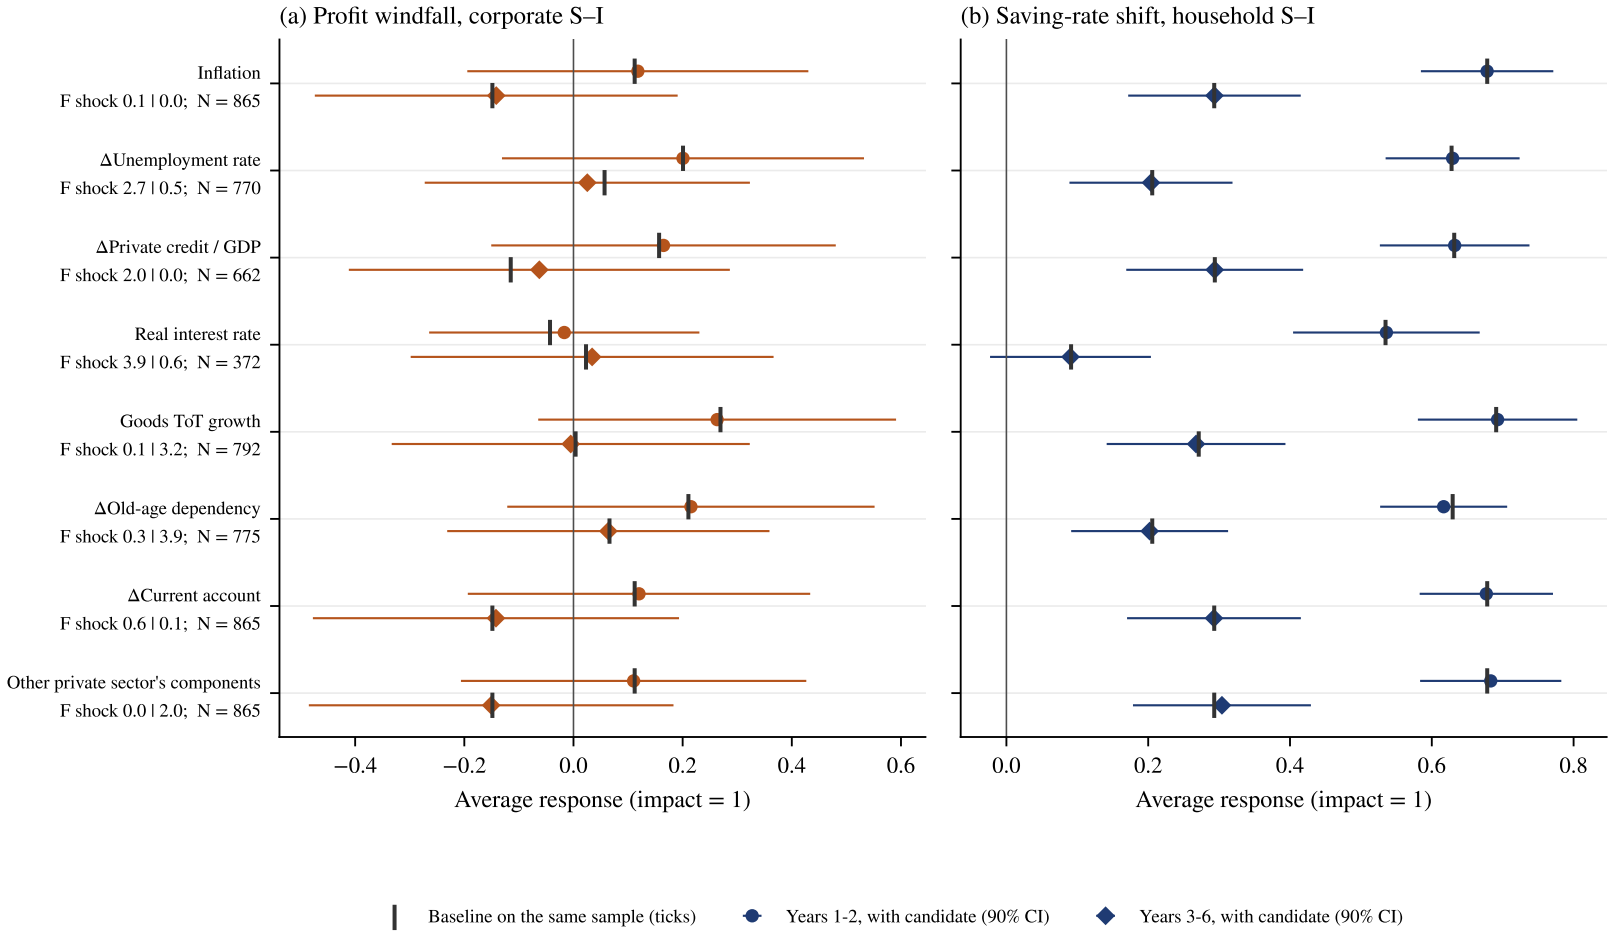
Additional control candidates



Notes: Baseline: own-sector balance (levels), the sector's two components, GDP growth and the two government components, two lags each, country and year fixed effects, two-step weighted least squares. Each row adds two lags of one candidate (levels if a majority of country ADF tests reject a unit root, first differences otherwise); markers with 90 percent intervals (country-cluster delta method), vertical ticks show the baseline on the same sample. 'F shock': cluster-robust F of the candidate's lags in predicting the corporate | household shock.
