

Notes: Each sector's saving = its investment + its flow-of-funds net lending + D, where D collects capital transfers, non-produced assets and the gap between the real and financial accounts. The total change in D is published (national saving − investment − domestic net lending). Households' share follows from their published saving (their investment is private investment at its 2025 share of total less government fixed investment). Baseline: the other sectors' D held at its H1 2025 share of GNI, leaving the rest as a residual. Alternatives split the rest as it actually split in the 2024→2025 half-years, for which sector saving is published (corporations 0.66, financial 0.26, government 0.08), equally, or entirely to corporations. Profit component = change in operating surplus at the H1 2025 retention ratio, common to all rules; retention component = the rest of the change in corporate saving.
