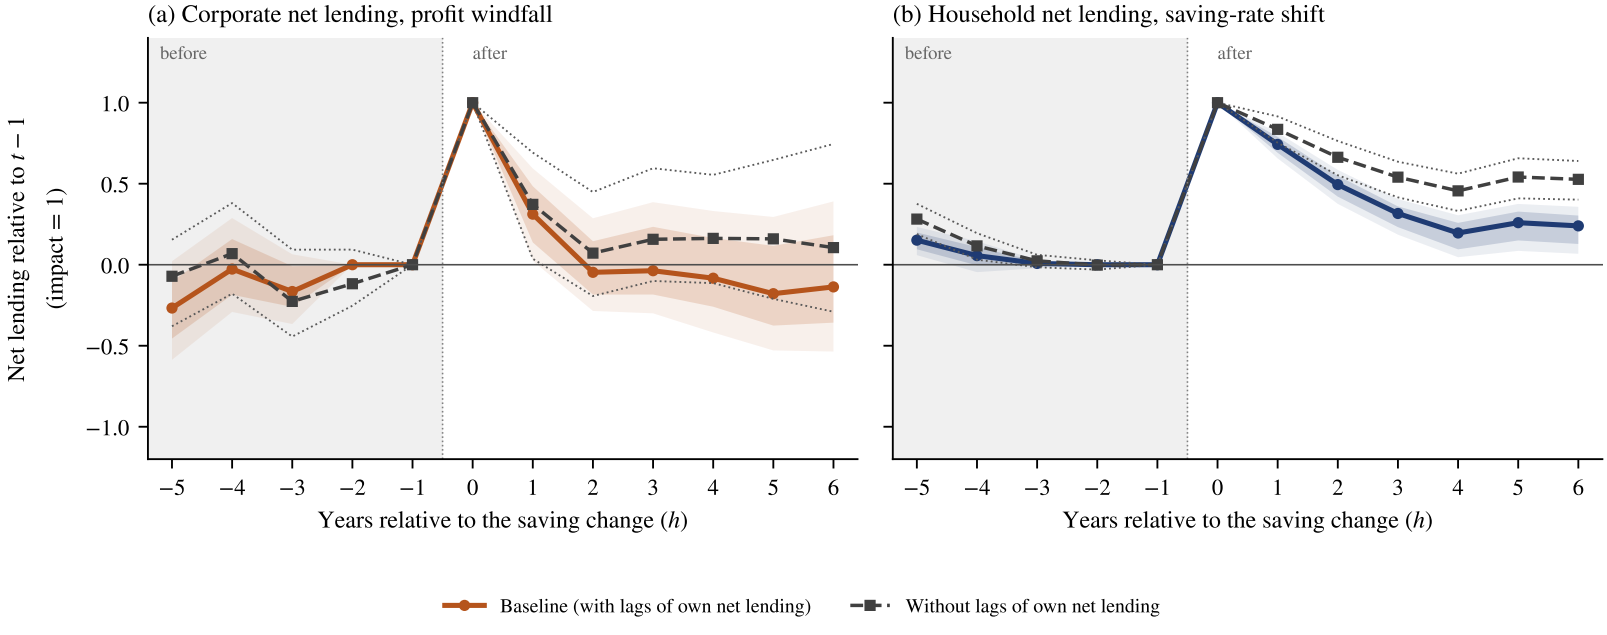
Net lending before and after the saving change



Notes: Annual data for 38 economies, 1973–2025 (unbalanced). Coefficients on the windfall or saving-rate component in local projections of n(t+h) − n(t−1); for h < 0 the outcome is the change from year t−1 back to t+h. With two lags of own net lending in the controls, h = −1 and h = −2 are zero by construction, so h ≤ −3 is the informative pre-period test. Dashed: the same controls without lags of own net lending (90 percent band dotted). Shaded: 68 and 90 percent bands, country-cluster bootstrap (999 replications).
